PREFACE

Through the cooperation of the contributors of the major surfactant-producing corporations, we are pleased to present a formulary devoted entirely to a variety of cleaning agents. The purpose of this compilation is not to educate the reader as to the physical and chemical nature of detergent ingredients but to make available a catalogue of formulas reflecting the current technology in the surfactant industry.

The formulas herein should be considered starting-point preparations and thereby used as the basis for further experimentation in the development of new detergent products.

The book is organized so that each chapter deals with major detergent applications. Within each chapter the formulas are further subdivided according to their hydrophilic nature which determines their mode of activity. These four categories are: anionic, nonionic, cationic, and amphoteric.

Unless otherwise specified, all formulas have the quantities of ingredients given in parts by weight. A list of abbreviations that are used throughout the formulary is included. All constituents appearing by their tradename are printed in boldface type, and the manufacturers' names and addresses appear after the list of alphabetized tradenames in the appendix.

Perfume Oil	q.s.
Dyes and Preservatives	q.s.

Procedure:

The order of addition is given above. Add all materials singly under adequate agitation. Continue stirring until product is homogeneous.

Note:

This low actives (9%) formula provides copious foam in the tub.

Perfume Oil	q.s.
Dyes and Perservatives	q.s.

Procedure:

The order of addition is given above. Add all materials singly under adequate agitation. Continue stirring until product is homogeneous.

Note:

The ethoxylated cocoate provides emolliency. The blend of amide and amine oxide provides a high level of detergency with minimum irritation potential not possible in a strictly high amide blend.

Procedure:

Charge water into a suitable making tank equipped with an agitator and having provisions for heating and cooling. Heat to 70-90 C with moderate agitation. Increase agitator speed and gradually add **Lexaine IBC-70**. When this is all added and completely dissolved, cool with moderate agitation to 40-45 C; then add and disperse balance of ingredients in the order shown. Cool to 25 C and fill.
